说话人 1 00:00:00
Thank you.So I'd even still have some concern on the equipment topics.So I think this one, right? Yeah, this one. Okay, go ahead. Thank you.

说话人 2 00:00:23
So first, I want to align what we have done for the improvement.And this two parts are all what we have already done.And for the first one is what we've done, completed to strengthen the process control and a mass flow meter and a sagas we added on the Aldi's motion transfer line.And the splimental verification of the synthesizer temper system, whole temperature limit.This one was completed and the synthesizer software was improved. Now we included the reports and displays.And for other principle improvements, we got the, for the procedure, we got the operator confirmation was added for waste discharge and system transfer and also the tuning folk level switch and plc software.I was modified and verified and for the parastotic palm tubing, which was not compatible with pro down, the DSC and the IPA contact.We change it to a metering pump.And for the process piping, the Protection preparation vessel and the accessory ancillary standard steel equipment was passivated and inspected, and then cleaned and tested.So this is what I just quick go through what we have done for the improvement.And this part is there are about us two main things we want to discuss and get your opinion on this. First one is the adding the high and low.Jacket temperature alarm for the Sy sixteen to the plc option 1 is what we're thinking.We can upgrade the software and it will provide audible and VI visual alarm for the high and low limits and.Together with the high and low pre alarm we have for now and the personnel will respond outside once the alarm is triggered.And so there are any excursion beyond the process range will be detected immediately.This is option 1.We can upgrade the software.And while 2 and 3 describes what we're current have the, we now, for now, we only have the high and low audible and visual alarm and they're set as the pre alarm.Value, which is a buffer value, and the personnel will respond outside and when the alarm is triggered.And so any excursion beyond the process range is reconciled between the, or the operator option record and the electronic data.We will, so that we will capture any excursion as

well.And also in our Mor, we already record the minimum and maximum temperature for each operation. So the risk of a missed excursion.mission is limited and。

说话人 2 00:04:16
他这个，这个方式验证了，就咱们那个 high load， MOR， 来 capture 这些最高点、最低点，还有整体的这个方式。

说话人 2 00:04:46
对。

说话人 3 00:04:57
也就是说你这个温度被 MPU 记录下来。对。后来改了。根据。这个最新的 GBDL。

说话人 4 00:09:52
那他那个企业中的点是以前没有高高报和低低报，现在要把高高报和低低报加进去。

说话人 3 00:09:59
对呀，那就是你M2知道是高高报低低报，就把它加进去。

说话人 4 00:10:03
因为现在整个这个程序它没让设置高高报和低低报。

说话人 3 00:10:10
反正现在是工艺需求，因为是框架，所以需要高高报和低低报。

说话人 4 00:10:14
所以说我们先要改这个程序，应该是。

说话人 3 00:10:17
根据M2，你知道M2你加了高高报低低报，把哪哪个词，你的程序就可以对方给。

说话人 4 00:10:26
配方是服务的。对，配方是服务的，但是因为本身现在我们的计算系统当时没有这个功能，所以说我得先改计算系统。对，那边有夹具没有。所以说我得先改计算系统的功能。然后这个计算系统的功能

先去做验证，这没问题了之后，然后呢我们才能根据这个工艺去配置这个高高报的、低低报的。然后这一块的。所以说这也就是为什么我们现在对于这个高报和低报的配置，涉及到计算计划系统验证，这一块，这个时间呢可能比较紧张。

说话人 2 00:11:35
对，后面我也说，软件升级要3天。

说话人 3 00:11:46
对，拜拜。行，他在加了，先放后。行。

说话人 4 00:11:53
能，这个因为整个的时间呢，大概是几天？是是是从你加到完成验证，不包括你撰写文档的这个过程。就从改计算计划系统到完成这个计算计划系统的验证。

说话人 1 00:12:17
In software upgrade. Yeah, it's really.

说话人 2 00:12:21
对，来写了一下。

说话人 4 00:12:31
所以说如果要是后面在过程中去做的话，其实我们也能做。但是呢，根据我们当前的控制手段，因为我们已经有高报和低报来提醒人员去介入一个过程，所以说高高报跟低低报更多的是帮助人员去识别。我们那个是不是超过了固定要求的范围？所以说呢，就是本身现在这个功能。其实是能够开始做这个问题的，这也就是可能我们想进一步来说明。

说话人 3 00:13:08
那么我们在验证开始之后，你如果是同步准备文件跟软件，因为软件就是会做文会运行，然后找一个时间，把它验证。对。对。哦，我知道，那我可以，我然后我验证完了，我这个有个时间窗口。对对对，这次结束了。对，时间窗口。

说话人 3 00:13:38
we' ve seen not enough time to implement.and we can turn the change document at software modification at the documention in the meantime.after we include our law.

说话人 3 00:14:10
engineering actually we have involved five hours and we can bring it online on the office.stop.I haven' t.what' s that one?driving a picture.just a talking.

说话人 3 00:14:59
We settle for all their internal temperature control.There are five high, low alarm.Okay, that's just not for checking.Oh, I wasn't considered.Okay, so I think we can start TV without the 5 high, low alarm, low radiation because.Are the change that software in the background.And once there you are change of training enter and you know, okay, okay. I think the following question is on the springboard.

说话人 2 00:15:40
Verification, right?So following that, so we don't need to do the high low, but still the coverage test.So the situation for this river verification is that we previously use has the Stanley's.Steel 3 ball and was used for the coverage test on the ATO9 vessel.And then we, the ailing is not compatible with product on the stand is still contact. So the sprays, the 3 ball was well.Will be only used as a temporary, is only used as a temporary accessory and will not remain the vessel, which means it's dedicate to this vessel.But when it's not used, we will put it out and when it's need to be used, we install it. And.

说话人 2 00:16:40
Now PTFE is Rabo has been purchased for the ATO nine and following Lily's recommendation, material compatible ability assessment.Given the project time, we recommend a trail run and completion of a supplemental.Coverage verification and clean confirmation before it is used for the project.And the proposed completion date is the 20th, tomorrow.

说话人 2 00:17:16
And for the situation of ATO, one is already has the swivel and has completed the coverage testing.The missing outside identification tag has been corrected, and we're thinking that one, wondering want you can opinion on.Whether the fixing spray ball is needed or not.

说话人 2 00:17:46
As the fixing the spray ball in place will take like 2 more days for validation and cleaning.And also we're thinking that the PTFE is actually relative higher risk than this stainless steel for the.S static, electronic static risk.So we're thinking we can keep the current rinse method.Point for now.

说话人 1 00:18:36
How do you mention my.

说话人 3 00:23:15
How do you do the production team?Yeah, I just mean introduction.So not the training, but introduction in production between first batch, second batch.Yeah, the in the thing method there is the interaction.We will manage this.

说话人 1 00:23:47
就这个写在生产前变更应该可以。

说话人 4 00:23:53
你应该是第一批生产过程中提一个变更，改的这个东西的清洁的实际操作。对吧？因为原本是。

说话人 3 00:24:06
移动的变成固定的。

说话人 4 00:24:07
从移动的变成固定的，然后在这个变更里面的增加光源和光速的测试，以及咱们针对于这个罐要在第二批之前完成一次，就完整的清洁。然后呢，这个针对于这个罐，从第二批开始一直去做。

说话人 1 00:24:25
So, this have.我们生产前变更，你现在这些信息。

说话人 1 00:24:33
So you're not really have a problem.Okay, so currently final fitting down, right?So such activity will be recorded in the G control prior to the second batch, right? Yeah, yeah. Okay. Okay. Okay.

说话人 5 00:24:58
If any of the rest of the team have any additional concerns as you're planning this, just let us know.It might be a good option. Okay, thanks. Okay, so that's what's up.

说话人 2 00:25:20

Yeah, it's actually, you just want to show example of it. It's a timeline for what, based on when we're.Going to do the charging on 10,20 second starting of 22nd and what the unit operate operation will be for the later timeline.And so we will also share the Excel itself to you and for your reference and to see what unit operation you want to inspect and.Can follow that time.It's just an example.So we didn't make it larger.Yeah, we will share it with you afterwards.Yeah, thanks.Yeah, we just wish that before you leave here, the production activity will be starting.Yeah, that is my goal.I want, yeah, sorry.Yeah, material dispensing will be started that time.So yeah, and the third and fourth are the qualification of iodine solution, natural transfer time, and also the.DMF coding time qualification, and we're suggesting to do both of them during the during the 7 run.As you in the 7 run, we will use the actual eluding solution and also the DMF as will be use the same during the production.And the Aldine solution is actually has high density, and so.That using other to evaluate and simulate is not that accurate.So using itself maybe a better solution.So we're suggesting doing them both during the S7 run rather than one is before the 7 run.Thanks.

说话人 2 00:27:22

And the 5th one is the removal of the deadline from the unused branch of our difference from one.And we completed that and the redundant wall has been removed and the PDF line branches installed and identified. And here is the picture.And the sixth one is also just information.It's the pre production acceptance of equipment train, rinse and swipe.

说话人 4 00:31:51

Of step two, L2 step.
