智能纪要：[20260929_200130 2026年9月30日](#)

说话人 1 00:02:13

hello, this is Tim.Can you hear me?Siming is a bit, you know, she'll be here quite soon.And before she comes, I would like to do brief introduction of myself.As I just stated on the insurance investigation team meeting, sorry, my name is Ren Qianyang and incoming Vicky.It's like everyone calls me that's up.And there was a growth since my surname is quite difficult to pronounce and I'm currently working with slim in the RND department.And in the future I will like be more participate in the discussion on the meeting concerning our project.Thank you so much.Feel such honor to speech in the kind of meeting.We can wait for swimming. Now she's having some technical problem.

说话人 1 00:03:18

那我。

说话人 2 00:05:19

打开，然后。

说话人 2 00:05:39

Okay, I'm sorry to the team.I was having some internet issue, got some problem in joining the team's meeting.So just going to share from Vicky's laptop as well, if that's fine. Could everyone see the sharing right now?

说话人 2 00:06:01

Yep, yes.Okay, okay, perfect.Directly jump to the timeline.So this is the third version of the timeline here.For the second, so this is the third version of the timeline, will have it being uploaded to the Sharepoint after being updated to the Sharepoint afterwards.

说话人 2 00:06:23

So we had some internal discussions in Acme Camping as well. And this is like a very raw version, very fresh version of the timelines. So currently, because with the, with also with discussion, not from with the team, we all know that we're going to have the acetyl concentration in the Pia being one of the control measures. So, we'll need to have the Pia to be released to with the SR out of high concentration be tested prior to the PPV, pre PPV campaign. And as such, we'll need to have.

说话人 2 00:07:01

The concentr, the SD other 5 concentration method to be validated. Prior to that, currently our, so our estimation is that this method validation will probably being completed. So the, the, the like the positive or like aggressive. Timeline will be that the method violation could be completed prior to the tenth of October. And after that, we'll have the all the document preparation and also the release test of the DPR. And after that, we're estimating that the pre vvq of step one could be probably started at October 15th. And with the timeline being this way, as communicated previously in the last ppt meeting, will be having the like the climate from wrong when we have the Pep title on reason from November 15th. And if we can collect the collect all the data and data analysis to prove that the or to confirm that the Stps is running as expected, we can start the pre PP, we can start the PPQ1 batch at the November of 28th, which is here. Which is several days later than, or like it has been pushed back. For several days compare with the previous timeline. And because of this PU pushback, we'll all, we also have the pushback of the start time of the Batch 2 SPS and also the start time of the batch 3 SPS. And therefore the release, the completion of release date of the third PBQ batch or for the stage one. And because of this pushing back, we estimate that will also leads to several days of pushback in the full completion of all of this P3PBQ batches.

说话人 2 00:09:08

So the manufacturing is currently estimated to complete at April 2nd, when we consider stage 2 and the release test take us 14 days. So the completion of release is currently estimated to be completed at the 16th of April.

说话人 2 00:09:24

And for the gaps between the full scale demo here and the preview. BQ for stage 2, this is the time left for the remediation plan of the, for, for the manufacturing for the for the plant, based on all the action trackers that has been left, that says that we'll need to complete those, not necessarily prior to the full scale demo, but definitely prior to the pre bq bash. And based on all the assumptions, will need to have the gaps here to complete the, to complete the, all the remediation. That being said, it does not, so the remediation does not lead to the postpone or any pushback of the timeline here. Because currently the time limiting. Sections or the time limit

parts are still the completion of the Batch 3 P B Q stage 1, if that make sense. So currently we still have some buffer here between the between each of the P B Q batches and also between the pre P B Q at the start of the P B Q stage 2. So this time, this gap here, we currently put it as around 2 weeks, around one week. And this one is currently estimated to be used for all the data analysis. So it leaves us around for three weeks F between the completion of the manufacturing for the pre PBQ and the start of the PBQ for the Stage 2. And also, like, it also counts as one week gap between the completion of the release and the start of the preview for the PBQ Batch 1 stage 2. And the gaps also, we also have gaps between the, between each of the PPQ batches in the stage 2 part. And currently for the 10 days, these are for the purification and also the cleaning is taken consideration. So the cleaning takes us around like, I think currently we're putting a week here. So it takes us 10 days plus seven days here. And also we have several, the several this buffer within this room as well. When we're looking at the more detailed date here, we'll have a more detailed version afterwards. But currently, we'll have a more detailed descriptions afterwards. But currently for the timeline here, we still have some buffer or we still have some gap here between each of the PPQ stage two's parts. So just want to have the team's thoughts on it. Any comments?

说话人 3 00:12:28

Okay, so if we do not have any comments, so come, this is Mark. Appreciate sharing this. I know Steve is not here today, so I can share this with him. And certainly I think this first, most of us seen the timeline proposal here. So we'll digest this and provide any feedback.

说话人 3 00:12:46

One question. I know there were a list of actions, Andrew and I. Have identified during our visit a couple weeks ago, and some of them potentially could have impacts on. Timelines and start dates for all these steps. Yeah, just I know you're still working through kind of the activities to remedy those actions or recommendations. Just curious if that's in, reflected in this timeline, or have you completed that exercise yet to evaluate impact of those actions on the timelines?

说话人 2 00:13:20

Yes, so currently the timeline, the gap here's the this blue line here between the pro full scale demo and the pre pbq batch is the aggressive estimation of the time will that will be taken for the remediation. So we did list the list a larger gap here between the full scale demo and the pre pbq batch. So that also means that if we say that we're going to push, if. Start of the full scale demo here, a little bit back backwards. That will also means that will need to further postpone or further push the start of the pre pbq batch for this stage 2 as well, because this gap here currently is the time that we left for acing camp team to complete all the remediation. That has been marked as prior to the pre PVQ.

说话人 2 00:14:24

And for all of this works currently we have so, and for the all of the works that has been put inside this gap here, currently it does not affect the influence, the final completion date of this whole, of this entire timeline. Because this entire timeline, currently, completion day, is still influenced mainly by the station.

说话人 2 00:14:50

One completion date. We still have some buffer here between each of the batches. So even if, let's say, we'll need to have several days of buffer for all the remediation plans or the ongoing activities there, we still have some room here to digest this elongation of the remediation.

说话人 4 00:15:16

So is any of the remediation plans have potential risk to the performance of purification? Because I'm just wondering if we do a demo and then we change things, is there anything that's changing that would.

说话人 3 00:15:33

You know, would it be helpful to do any of that before the purification demo? Just throwing that out there. And I'm not aware of all the details of all of the changes that were proposed. So, Mark, maybe you're better. Yeah, I think that's it. I think it's a fair question. And I think, Simon, it'd be helpful. I don't think we've seen it yet. And I thought your team committed to sharing that today, but I don't know if you have an update on like the actual list of. Follow up actions and your team's thoughts on target dates to complete those actions. I think it'd be helpful to see that in detail and work through that list to really understand what actions might be driving timeline impacts. Yeah, for sure. I can relate that. Do, do you have, does your team have that prepared or is that still being worked on?

说话人 2 00:16:23

I think we have most of them being prepared. I know that we're having quite. Like, we're having quite active discussions about all the remediation plans and all the possible timelines in influence of all that remediations, what task should be put in which parts and like what are the for all the communications with all the vendors that we have. So I know that we're like in the background there is.

说话人 3 00:16:52

Active discussions related with that. I think both of them should be completed, and I will let you know afterward if we can directly send that. And after this meeting. Okay, I think that's probably really important that we, and I don't intend to rush that activity necessarily, but I do think it's important that the sooner we can have a holistic view of. The actions and the timeline to complete those, I think that'll give us a better sense of which actions might be driving this broader timeline here. And then we can have those discussions. Certainly, if there are individual actions that are critical path and ensure that we're focusing on the high risk items.

说话人 2 00:17:33

And, and weigh in that risk versus timeline. Yeah, for sure. I think the current plan is that we're going to share the, the, like the. A SIM can completed version of the action tracker by I think that's 10 a.m. in 8 in US time. So basically 10 p.m. in China time. Okay, it it that be great. Yeah, I guess we'll look for that later today and maybe we can have some internal discussions.

说话人 3 00:18:03

Us time today and get back to you. But yeah, I think the sooner we can see that and digest hum those actions and timeline impacts, that might help inform the schedule a little bit more clearly. Yeah, understood. Yeah, we'll look forward to that. Thank you.

说话人 2 00:18:20

And also, like that being said, we also, so there's several parts that would like to highlight it. That is, so we have the, so when we're looking at the timeline here, one thing that would like to note is that the, we do not leave much time for the method validation for the analytical team. So this is that one parts that might.

说话人 2 00:18:48

Gate the start of this pre BQ batch. And also as mention, like as you just mention previously, so we also have a quite aggressive timeline here for. What do you for all the recommendation. So that is also one thing that is in camping is also taking into consideration. But given that we still have some buffer with all the batches afterwards, that will probably be our like second red flag here.

说话人 2 00:19:20

So, the reason that we're currently w with currently would like to brought this up is that we would like to confirm with the team about, let's say, I know that acing camp team is currently having discussion with Lili's and also team. And currently we're. We were thinking about having the using the HPO see method for the testing of that's your outline in the DPI. So just want to

make sure that we're all aligned and we do not do any specific changes during this process and will. So and also like. Would it be possible for the team to also recognize that during this process, we'll not, we'll need to have like a quick turn around of all the documents just to ensure that the target start time will not be postponed further. If that's fine. Yeah, Chris here from analytical were. Turning around those documents as quickly as possible. So, yeah, yeah, we'll do our best with that. Yeah, we recognize that. So thank you so much. So, and also like in the following days or weeks, like in recently, we'll also be there probably be also some other quick communications. With the living that's more related with this topic.

说话人 5 00:20:50

Yep, sounds good. Thank you so much. And after that, some discussions relate it with the, I think I'm pretty, just a quick note. So I think Steve asked a good question. Could we follow up on that, like following the list of changes that we want to implement and get back to us on, whether that impacts the. The purification, how the process is executed in the demo versus the pv as well as, I think one of the outstanding items Steve was looking for was kind of more detail granulars, day plan for action on the demo batch, assuming that it starts on October 5th.

说话人 2 00:21:43

Yes, that is something our team is also working at. We'll make sure that we're going to send it over basically at the same time as well. We're going to send over all like the revocation plan as well. Thanks. And so that's the intent of the list Andrew and I created again with Austin Camp's feedback. Once we have a sense of timing to implement some of those actions.

说话人 3 00:22:08

I think we then can have discussions around the actions that might have an impact on schedule. And yeah, just understand the criticality of those actions, whether there's room to work on those either in parallel or post demo or post PV even. But first, I think we need to understand just the timing. Aspect of addressing those, some of those gaps. Yeah, I think I understand. I think many of those in purification were BLA related. So again, that's where the risk might fall from, particularly around cleaning capability and challenges with cleaning the rig based on the equipment design and piping design. Yeah, that's true.

说话人 2 00:22:57

Yeah, we will definitely get back to you. We'll, we'll make, we'll try our best to get back to you by today's 10 p.m. The like China time, eh? Yeah, and I can appreciate that, Simon. I know that's a, there's a lot of actions and probably a lot of activity ongoing in the background at Asian Camp. So.

说话人 3 00:23:18

Certainly sooner we can have that discussion, the better. But I do it, I think it be best or most helpful if you have time to evaluate those timelines and provide kind of a realistic view of what it will take to address those gaps. Yeah, and also just one quick question. So in last week, I know that we have the previous Purification JPC meeting to be the.

说话人 2 00:23:42

Meeting about the discussions do so in this week. Do we still want to keep that meaning like also like in the in all the following discussions, do we want to keep using that time slot for the discussions of the timelines and the order do a related topics or are we planning to find some, I don't know, other time slots for the discussions or like, what's the plan right now?

说话人 2 00:24:14

Which meeting are you referring to, SIM? Apologies. So like last week we had the, we have used the previous Purification JPT meetings time slot for the discussion of cleaning and for the discussion of BVR related topics. I like we were planning to use that meeting to also discuss the action trackers, but at that time. I think campaign was not fully prepared. So we have some other related topics for the discussions as well. Just want to make sure that are we still keeping that meeting, keep using that time slots for this week's discussions, or are we thinking about using some other time slots in the future?

说话人 3 00:24:59

So, yeah, I think Steve and I talked about this. I, it seems to me that we will likely need some dedicate time for the teams collectively to review that list you provide and talk about kind of timeline impacts and focusing on efforts to remedy those actions. So it may be best to have a separate time slot.

说话人 3 00:25:23

It's, I don't know, for the folks on the purification side, I know you've scheduled that meeting to discuss kind of purification related PV readiness activities. So we certainly could utilize that time slot if that works for the rest of the team. But I think that may be best to have a separate. Meeting scheduled as possible to focus on that list and talk through that. Yeah, I think we still need to have the purification discussion as well cuz there's, yeah, still some outstanding items there too. Yeah, that would be my thought as well, to keep that focused on purification.

说话人 3 00:26:01

PV readiness activities. So I'm sure there's a lot of ongoing discussion there. So yes, I mean, once you share that list with us today or when that when you complete that and share that list, it again, it might be best to have a separate meeting scheduled here as soon as reasonably possible to focus on discussions related to those actions. And keep that JPT call on Thursday for purification focused at discussions. Yeah, I think it's specifically the SPPS Mark in terms of priority or I think we probably need to digest that a bit collectively with the smaller focused group. And then we can maybe take those actions and bring those to the respective teams. Yeah, I think that'd be the part, the best, most effective way to tackle that. Have a focus team to review the timeline impacts and the action timing that you provide Simon. And then we can work through how to best handle that with the JPT teams individually.

说话人 2 00:27:13

Yeah, sounds good. And also one thing I, sorry, I just remember this. So one thing is that currently I'm having trouble in logging into the release account. So currently I do not have access to the teams as well. So in in the future, we'll be.

说话人 2 00:27:33

Maybe possible for us to have, I don't know, like a group chat where we have multiple key 18 cam folks and also the key, the things folks focus on the GG 9,1,7 projects and we can have the communication in the team's group chat. Does that sounds good?

说话人 2 00:27:55

So, because currently there's, there has been some messages that just sent to me and as I have difficulties in logging into it currently I have the feeling that there might be some information that has been missed. So would be possible for us to have like a group chat. For all those small messages, small informations that would want to have immediate answer or a quick answers.

说话人 6 00:28:30

Sorry, Simon. Hi, it's Simon here. Would you mind just sending an email just to myself and Steven, just with the teams issue you have logging in and we'll take it from there. Okay. Yeah, sounds good. It's probably best. Yeah, I think that sounds like a good starting point rather than starting another group chat.

说话人 3 00:28:53

Again, I think it'd be best if we can have some like focused meetings for these topics on the list that we provided. And then maybe once we've aligned on the path forward, tracking those for

each step independently in the already scheduled JPT calls, hum and technical calls. So at the moment, there's the JPT on at this time on a Tuesday, but then also at the same time on a Friday. Is there any other JPT calls?

说话人 2 00:29:21

Say the one on the Friday is for purification. These are the only two JPT calls. So this JPT call is currently the stage 1 JPT calls. And the ones on the Friday is the stage 2. Well, previously it's the stage 2 JPT calls. Okay, let's say for the time being to keep them as they're.

说话人 3 00:29:41

And then, yeah, I would agree. Yeah, I would agree with that. And then again, maybe a sort of a special session if we can this week, still at the next day or two, once you've finished your review of that list of actions, just to focus on. Understanding the timeline to complete those actions. And then we, again, we can feed that back to the JBT teams directly if there's specific concerns on schedule impact. And work through them in that, in those forms. Hum. Yeah, sounds good. So again, once you share that list, if you can just I know Steve is out this week traveling, but if you maybe let me know, we can kind of work collectively to kind of find a time might that might work for review of that list between the teams, the smaller team maybe to focus on that.

说话人 2 00:30:35

Sure, yeah, sounds good. Thank you. We'll do definitely. So when when we sent when we upload that, we will definitely send an email for the notifications. And after that, we can have. Like when the team has time to remove that, to review that, we can have time to find the appropriate time slot that works for both team. Then we can have the meeting to basically discuss that action tracker spreadsheets and to make sure that we do not left anything that is critical behind. Well, we're thinking about all the remediation and we're making a proper start points, start timeline for the preview queue batch.

说话人 3 00:31:30

I said the other two things from an SPP's perspective that I think I'd like to talk about, I don't know if you have prepared or not, but just two items that probably also could impact timeline here. I know there's the N+53 investigation, obviously. Yeah, it just again, don't know if that's incorporated into this timeline as far as. Deviation right up and cap implementation. I think that's something we need to start thinking about. I think we're getting close to.

说话人 2 00:31:58

Aligning on the prepare campus here. Yes, and also, I think that's also one point about of having the of what we just had previously. So we would like to align with him as soon as possible with the with like the exact campus that we're going to implement and.

说话人 2 00:32:19

All the document drafting is currently ongoing, but we'll definitely need to have more details input inside it. And we'll need to have the final decisions of all the cups that will be implemented that.

说话人 2 00:32:33

And also one thing related with that, so the, oh, like in the following slides, we also have some. Document related with the pre pbq batch. So the documents that should be completed prior to the pre pbq, basically it's all the documents that is also going to be complete prior to the PBQ batches, and there are several of them that. Does not necessarily related with the m plus 53. And some of them definitely related with the m plus 53 impurity investigations. Currently we're pending for the we're pending for the PFD for the for all the document approves approvals. So would like to confirm with the team about the plan that we currently have for the PFD files. So I know that previously we said that will probably have first version of the PDF and after that we do an upgrade of that version. So we have a s and then we have a second version of the Pdfs just to make sure that we can start the sequence of. All this document approval, just want to confirm, is that still the plan or are we just planning to have, let's say, the second version of the PDF to be the first version so that we directly implement all the current communications or the current discussions related with sample 53 in that second version of PDF as well.

说话人 6 00:34:08

So at the moment, the first version of the PFD hopefully will be approved and shared with Azim can by the end of this week or early next week for spp's for step 1 in terms of do any of the kappas we're proposing tentatively for the investigation, those require PFD update.

说话人 2 00:34:30

Tentatively, yeah. I was thinking that probably we so correct me if I'm if I was wrong, but I was thinking that for the first version of the PFD, we do not necessarily needs to have the capacity and all the others related with the m plus 53. And after we have the completion of the m plus 53 investigation, that will lead us to the second version of PFD. Is that correct?

说话人 7 00:34:58

I can make and I'll make with them in. Sorry. Yeah, Rob, go ahead. No, I think that makes sense. I think particularly around the nitrogen sparge, I know we've a little bit more conversation to go on that, but we're gonna have to include that control in the relevant version of the PFT. So version two, yeah. So gonna have to capture that learning for sure, cuz it's gonna impact the NBR as well. So that would.

说话人 6 00:35:28

Their primary data source. I'll make a note with Simon, and we'll get back to you just in terms of the actual flow of the two, the different versions and if the cappers are built into the PDF. I'll get back to you. Thank you so much. So the reason that I'm asking is that because maybe just jump to it.

说话人 2 00:35:50

So, because currently our team is planning to have the document approval sequence as such, and currently the planned start point of the document preparing or like that's the document preparation is at. The, so the overarching chain controls is plan to start is approval on October 1st. And if it is the case, we'll need to have the PFB being set over quite recently.

说话人 2 00:36:30

But that being said, we still have some buffers here as well for the all the document sequence. So even if we have sometimes like gap here's we will still be able to complete all the document approvals prior to the current timelines. But. Currently, we do not have that much a gap that could, like if we say that the PFD could only be at the end of this week or the start of next week. That will list to around like 4 to 5 days post will pushing back for this timelines. And that will probably leads to the. That will probably leads to the change of the whole manufacturing timeline as well. Not significantly, but definitely will need to reassess it. Yeah, and I.

说话人 7 00:37:28

Think, I think that's probably back to Mark's comment earlier about the deviation. So that's gonna drive the major changes here. So the sooner we get that work through and approved in our system, the sooner we can start capturing the relevant data related to the acid aldehyde spec and the nitrogen sparge, in particular in the documents. I mean, we could progress with this timeline, but the caveat is once that deviation comes across to us in the capers have been identified, some of these documents will need to be updated to PDF.

说话人 2 00:38:00

Be in particular related to that then is the Mor, and you probably have a change control to go with that. You don't want to make maybe the, yeah, we understand that. But like the like looking at the timeline here, there are also other documents that does not really. Related with the m plus 53 and currently is also pending because of the, because we do not have an approve version of the PFT, if that make sense. So that's the reason that although we know that there will definitely be other documents that will be gated by the m plus 53 Impurity investigations.

说话人 7 00:38:45

We're still asking if it's possible for the team to set over the, at least the first version of the PFD. Like recently, I think we can do that. I don't know from a queue perspective. Any concerns guys? I mean, we're not gonna get started until the deviation is approved anyway, and that will drive PFD update. So.

说话人 8 00:39:09

In the interest of time and getting this documentation train going, I think we can send across the version 1 of the PDF. Are you talking about the approved version or the draft version? Rob? Approved. So I know we don't have it approved in our system. And I don't know if the plan was to wait for the updates to come through before we did approve it. But I've no issue, as long as we have it revised in time for whenever we start pre P P Q, if it is going to be time saving. But if it's a case of that, it's gonna cause a knock on, a lot of knock on revisions and take time there then. Would we better off waiting a few days? I, again, I don't know the timelines. I'm getting this deviation and to a close either. So if it's a case that it's gonna help with the update of the other documentation and getting this approved and through, then fair enough. But if it's just going to cause a lot more of rework, so we need to evaluate that as well.

说话人 7 00:40:04

I think we could push version 1 through. Okay, the deviation is gonna take far more than a few days anyway. You know, it would be a miracle if we got that over the line in a week, to be quite honest with you. So we just need to, I think we just need to get the PFD going version 1. Once the deviation is across, then we're gonna be back into some updates on these documents. But at least we have the bulk of them done.

说话人 8 00:40:28

Yeah, and if there's information from the deviation, that's gonna have an impact on our Pvp, and which there will, and any other of the documentation is not gonna, I suppose help with that. But if it's gonna help with providing information, then fair enough. Have we seen it? Is your team started a draft of that deviation right up, Simon?

说话人 3 00:40:50

Cuz I think that may be the bottleneck of this ultimately, if I had to guess, I think it'll be challenging based on my experience to get that turned around in two weeks potentially.

说话人 3 00:41:02

Just to make sure when we're seeing deviation, are we referring to the m plus 53 in purity investigation report or is that a second document? If you think, okay, before that, I think we also need that. Yeah, exactly. We'll need to see the deviation right up at some point and review that. And that potentially could take some time to work through that review. And then.

说话人 5 00:41:29

Yeah, as we talked about, just the cap is out of that. How do we track those activities as well and incorporate those into the documents? Just one quick note I wanted to add regarding that deviation. I know Asim can is working on that report. Can Asim can share whatever draft you have so far so that we know if any other. Document is needed. That's No. 1. And No. 2, I know our PR and Equality, Shawn is working on a deviation to be raised on the Lily side as well. So we can probably rope him in, Sarah, and kind of get to the bottom of that, like combination of ACM, Cam.

说话人 3 00:42:11

Report on the RCI and Shawn's deviation, would that be sufficient is what I'm getting at. I know it's under the development queue oversight, but is the expectation that both Austin, Cam and Lily have a deviation documented for this? That was my understanding of us. Yeah.

说话人 8 00:42:33

But again, I need the confirmation with Shawn, but my understanding is that a deviation be raised. And this has been documented under deviation.

说话人 3 00:42:45

Think that probably is be aligned on quickly here. Again, if there's a formal deviation based on what we normally see in the APIM oversight, that typically be a pretty, pretty, yeah, be quite a bit of work there to probably work through that. In this time frame. Hum. But I don't know from the development side, that's the expectation or if there's a different.

说话人 2 00:43:12

Approach here. I will probably also need to relate back to acing camp team as well to just to confirm if we have the deviation corrected or not. My like my primary estimation is I answer is no, but I will need to confirm if we probably have one.

说话人 3 00:43:50

So I would say there's probably a critical follow up for both sides here to understand what the expectation is. Again, that probably could drive the timelines here. Potentially if there's a formal deviation requirement. Yeah, I, if that's the case, that will definitely leads to some changes of the timeline here. I was assume.

说话人 2 00:44:11

And also just to confirm, so when we're saying that we haven't deviation here, what are the, let's say, what are the standards that we're referring to when we say the deviation has been happened?

说话人 7 00:44:34

That's a good point. So yeah, we need to evaluate the that point exactly. So what was the specification that we're trying to adhere to is kind of where you're coming from. So I think it needs to go back to s and d's quality function. So Suber, maybe if you could take that and run it by show. Yeah.

说话人 5 00:44:56

Rob, I was just. I am in Shawn and Sarah right now. So basically, Shawn has all the information. So I provided kind of the summary de summary report of everything that has happened so far. And he's taking that generation of deviation on his end. And to be honest, my understanding was that Asim can was to provide that comprehensive root cause investigation report and we move on. I mean. If the expectation is slightly different, let's immediately like align internally. So I'll kind of reach out to Shawn and Sarah and kind of share our previous communications with Sarah as well. And we'll provide our aligned information to ACM. Camisa, let's take this internally.

说话人 3 00:45:40

Okay, thanks, Supa. Okay, thank you, Simon. The other, to change subjects here, maybe quickly, the other, there's another deviation that I think is a deviation based on the observation Peter had on the residue on the activation vessel agitator blade. Yes, but I do think that needs to be resolved as well before we start here. And I know you had the write up and investigation which we reviewed and provided some feedback, but just want to make sure that's incorporated into the timelines and tracked as well.

说话人 2 00:46:15

Because there may be some remediation efforts there. Yeah, I think the division report has been sent over. If not, I will, I will make, I will check internally as well. But I think you did already seeing that. Yeah, you did send it. I think we provided some feedback. And again, I think the investigation seem.

说话人 3 00:46:37

To highlight the gap there around rust on a, on a weld on the solvent header line. I think just wanna maybe make sure your teams thinking about, I think you've identified some cap. Is there to address that? But just wanna make sure that's part of the timeline as well. And then I think that probably feeds into the broader passivation gap that we talked about. I think in light of that, we've still have significant concerns around that lack of passivation on the solvent headers in the system. And so I think that's that was one of the actions for follow up that wanna maybe understand timeline impacts as well. If you were to try to address that before PV start, and again, in light of the observation with this deviation, I think that just strengthens our.

说话人 2 00:47:30

Justification or our concern to address that gap. And just to make it clear, so if we're going to, let's say we're going to have the assessment about like without the have the assessment to support that, we can move forwards. For now, without the passivation of the solvent line I, is there a place that the team would like to have this assessment being documented? Or is that so not quite so sure if that's something that we should put in that specific activation can deviations or not.

说话人 3 00:48:13

Cuz that doesn't solve. So I think at the right place, I think so. And there's fundamentally a gap in your policy procedures internally for qualification activities where you're not passivating those lines, and this directly led to a residue or. Rust observation in the activation vessel header, and I think that's an example of just the concerns we have fundamentally for all of your solvent headers and lines that were not passivated, all those welds potentially could have similar issues with rust, which. Pose a risk to the process, obviously, introducing metals. And I think that in a line with the fact that we've have a deviation on the Lara process where we think the iron metal catalyzed impurity was formed. Yeah, just raises concerns around. The status of those solvent lines going into the validation for both processes. So again, I think we probably need to talk about that in the focus meeting in the next day or two. Once you come back with like proposed timelines to remedy that gap. So I do think it's tied to some degree to that observation on the cleaning deviation, where. Again, there was rust on the weld that dripped down on the agitator

blade and that was observed after the vessel was cleaned and released. But I think it does raise just again, questions, concerns generally around the status the equipment.

说话人 2 00:49:53

So I think that's a, one of the topics that's probably potentially most time sensitive if we have to address that before PV. Yes, that's true. So if they say, I think that we're going to have the silver lines being passive agent. That will definitely be the one of the major topics that is influencing the timelines.

说话人 3 00:50:15

And again, if there's a path forward where we can justify that, we don't have to do that. We can discuss that. But I, yeah, again, just we have now evidence of that risk, you know, observed evidence of that rust on the solvent header to the activation tanks. That's the exact concern I think we had. So, so again, just maybe highlighting that deviation needs to be resolved as well. Hum, and then any other actions that might come out of that prior to starting? Okay, got it. And I think one of the actions that we've spoken about, and we haven't finalized the actual method here, is.

说话人 7 00:51:00

A solvent run. I don't know. Did you have that in the timeline, Simon? We discussed the, the how we're actually gonna do it and sample, etc. But that was one thing we were talking about. Is it in there? Yes, we currently are planning to do the solvent run for the FTPs, if that's what you're asking. Yeah.

说话人 5 00:51:23

Okay. And where is that? Sorry, Rob. I wanted to bring that up as well. I think we received the Mor for the solvent run. I wanted to see by when Asim Kim wanted our feedback on that because we would like to certainly have our internal team review and see if we're capturing all the right.

说话人 2 00:51:44

Right. Information from that solvent run, I saw that's a delta high levels probing was already included. So we do have an Mor right now. And so also like as mentioned previously, so we have already received some. So we're planning to do the solvent run. And as to the just mention, so we have already set over the AMRS.

说话人 2 00:52:09

There's that there's a lot of comments related with the Mrs.And acing camp is currently adding the m or based on the comments that has been left.So most of them, I think, as far as I know, most of them are related with the editing arrows. So some titles related and also others related.For the process itself, do we have any like major topics we like to discuss for this open round?

说话人 7 00:52:45

Yeah, I haven't seen the detail.I haven't looked at that document, but I think high level what we want to do is to sample the solvent at certain points to make sure the acid aldehyde level isn't increasing.And also I think we probably want to test the nitrogen sparage as well just to make sure everything is in order there.So off top my head, they're probably two big topics we'd want to address.So maybe we want to test the nitrogen spark in the solvent room.Like what I imagine.So I mean, in terms of the setup and make sure there's no mechanical issues. Okay.To make sure that I, from an ops perspective, it's, it's in control.No changes like we mentioned earlier, no safety issues.I know you said they you don't expect anything, but seem like a good place to test it.Yeah, yeah, that makes sense.Not for not from a HSN removal perspective, I suppose just.Just to be clear, yeah, for just some, a setup and safety perspective.And also, wait to say, I will quickly confirm this.

说话人 2 00:53:59

师兄，我们希望客户什么时候就这个算完了给我们答复？就他们那个 MR，我们现在改改到什么程度了？

说话人 9 00:54:09

等一下啊，明天发过去，三天呗，10月3号。

说话人 2 00:54:13

我们预计什么时候开那个收利试车？

说话人 9 00:54:17

这车兑换完了，估计他们也做清洗检测，估计二号。

说话人 2 00:54:22

预计10月2号开，我们现在已经在做管道管道动画。

说话人 9 00:54:25

动画已经完事了。

说话人 2 00:54:26

动画已经完事了，在清洗。

说话人 9 00:54:28

清洗完了又测来库。到2号。2号。第三步，咱3号启动也来得及吗？

说话人 2 00:54:34

预计3号是吗？对。

说话人 9 00:54:35

是突出出有病。

说话人 2 00:54:37

所以我跟他说三四号左右我们预计启动。对。然后看他们能在此之前给我反馈，我们他们可能还有要改的哈。我先警告你。

说话人 2 00:54:45

And we'll meet at the five people meeting. We can have it. Okay, let the team. So we will. So currently, as mentioned, they seem camping is adding the Mrs. And we're going to send a newer version of an updated version tomorrow. And we're currently planning to conduct the Silver Run on the 3rd or 4th of October. So if we can have all the comments being addressed and all the changes being completed prior to that time. That will be really nice. But also, so currently this start of the pre P P Q is being set at the 15th of October. So we still have some time there. So does that sounds fine to the team if we say we want to have this over run at this 3rd or 4th of October.

说话人 10 00:55:44

Yeah, if you could send on the updated documents, Simon will prioritize it. Okay. Thank you. Thanks. And I hate to add any more work here, but if we're doing a solvent run, is there an opportunity here? Should we pull samples and test for iron? I don't know what that looks like, what method we would use or instrument, but, and it's probably something to take offline and think about, but maybe that's an opportunity.

说话人 3 00:56:20

I just wanna, yeah, Chris. And I think that's a good thought. I know there's been discussion in the background if passivation prior to PV is not feasible within the timelines, is there an alternative approach to sampling monitoring that we can stand behind as an alternative? I, that's been discussed, but I don't know if we have alignment. On that yet part of, again, part of that is wanting to see ACM's proposal on the timeline to passivate the lines because if that's probably the preferred approach. But if there's significant impact, we need to probably have that to.

说话人 2 00:57:00

Discussion. Yeah, so for the passivation of the pipelines between the, so the equipment itself, so the passivation of the pipeline between the activation tank and the SPS reactors, this work has already been completed. And for the passivation of the solvent to, from the tank from, to the SPS reactor. That will definitely lead to like a large impact of the timelines. And also, I think Lara team has also communicated with the team about that one, about that as well. So I think the alternative way that currently having Lara team is that they're going to do some testing. To like to support that, to have some data to support that. Even without the passivation, the current pipelines are still good enough. Yes. I mean, I think in light of the.

说话人 3 00:58:03

Deviation with the rust observed on the weld for the header, did that just raises, I think, more concerns around this gap. So I think that's just something we need to discuss and align on a path forward here. Yeah, and that's kind of new information. I think it's as of the last couple days. So just trying to. Digest that, think about the risk collectively. So, but yeah, I think that's a fair point Chris said that there maybe there is an alternative path forward, but we'll have to discuss that in some detail and align on a strategy. Yeah, that makes sense.

说话人 2 00:58:45

And also, I think we're currently at the time, at the completion time right now. I think we're listening several folks right now. But just a quick overview of all the documents lines here. So currently there are several ones that we're pending for the final confirmations and several ones we're adding from 18 cam side. For the gap assessment, currently we have the team review and we're pending for acing camps editing specifically for all the other documents related, we have some more detail discussions that is written here in blue for the change control, specifically, would like to mention the change control for the DPI specifications is currently under draft. And once the Analytical Methods has been come effective, the change will be approved that the and all the Ro raw materials specifications will also be updated to support the release testing of the DPI. So this is one document that has been newly added into this list. Any other topic related re we would like to discuss on the GPT meeting due to the time limit here.

说话人 6 01:00:03

Can toy in with Xu Wang just offline, Simon just on the documents as well. But it's probably best to make a note of say the two deviations and any kappas that are coming out of them that need to be built into the documents as well as the PFT update going forward just to note them. Yeah, cuz I'd say a lot of these documents will get affected by.

说话人 5 01:00:24

Campus hum. Thanks. Thank you so much. We're at time. Can you kindly keep us posted weekly on the progress on the front run study plan that we have. Last time, last we got was an update last Wednesday. It was through RP two. Is the 500 gram material. That's an important. Important data piece we're trying to keep track, so doesn't have to be discussed at the JPT. But if you can at least share the slide weekly concurrent with the JPT, that would be helpful for us. Yes, honestly, you all. And do we have any other topics?

说话人 2 01:01:17

Thanks. No, then thank you all. Thanks, Sam. Thank you. Yeah. Thank you.
